

MODULE 7 · CHOOSING AI FOR YOUR LAW FIRM

Owner Map + AI Policy Outline

Governance fails because nobody owns it. Name four people — not committees.

1 · The owner map

Owner	Name	Accountable for	Can decide alone
Business		Whether this delivers the outcome	
IT / security		Access, connectors, logging, kill switch	
Privacy / legal		Client obligations, confidentiality, disclosure, retention	
Professional reviewers		Sign-off on output, per workflow	

2 · The inventory — start it today, even with one row

A list that starts empty and grows is governance. A list started after the fact is an archaeology project.

Model / tool	Prompt template	Connector	Data source	Automated action	Owner

3 · Policy outline — one to three lines under each

Heading	Your firm's line
Permitted tools — the specific list	
Prohibited data — concrete enough to act on	
Client disclosure — when and how (check engagement letters + outside-counsel guidelines)	
Review requirements — which outputs need a qualified reviewer	
Record retention — what, where, how long	
Incident response — who to call, what to preserve, how fast	
Training — who completes what, before access	

Do not invent the risk framework. Start from the NIST AI Risk Management Framework and its Generative AI Profile — it names confabulation, data leakage, prompt injection and over-reliance, and gives you language you did not invent.

4 · This is an operation, not a launch

- ☐ Monitoring — who watches accuracy drift, and how often
 - ☐ Knowledge-base maintenance — who keeps the collection current
 - ☐ Periodic re-testing — especially after any model change
 - ☐ All three written into someone's objectives
-
